FAQ for Xemacs Cut and Paste Fix on Exceed 7.0

Symptom:
Everytime the user would try to cut and then paste inside Xemacs/emacs using exceed, Exceed would crash with a General Protection Fault.

Resolution:
Emacs/Xemacs uses the non-standard secondary buffer for cutting and pasting inside emacs. The problem doesn't manifest itself until the amount of data that is being copied is about a page or so in size which exceeds the size of the primary buffer. To fix the problem open up the exceed configuration tool and select Xselection. Change the Primary to Secondary and then restart Exceed. This should resolve the problem.
